Charging is not necessary unless 100% of capacity is required.
Charging before use is necessary to help recover full capacity.

**CYCLE LIFE IN RELATION TO DEPTH OF DISCHARGE**

Testing condition
Discharging current 0.17C (FV 1.7V/cell);
Charging current 2.45V/cell, max. 0.25CA;
Charging volume 125% of discharged capacity.

**CHARGING**

**Cycle Applications**: Apply constant voltage charge at 2.35v/c – 2.45v/c (14.1 – 14.7v for 12v Monobloc) at 20°C. Initial charging current should be set at less than 16.5Amps. Switch to float charge to avoid overcharging.

“**Float**” or “**Stand-By**” Service: Apply constant voltage charge of 2.25v/c – 2.30v/c (13.5 to 13.8 volts for 12v Monobloc at 20°C. When held at this voltage, the battery will seek its own current level and maintain itself in a fully charged condition.

**Temperature Compensation**: Charging Voltage for both Cyclic and Standby applications should be regulated in relation to ambient temperature. As temperature rises charging voltage should be reduced to prevent overcharge and increased as temperature falls to avoid undercharge.

For further charging information including temperature compensation factors, see Power Sonic Technical Manual/Power Sonic Charger specifications.
